

NLP 244 Assignment 1

Ryan King

January 2026

1 Running the code

Because I was getting conflicts with the package versions provided in `setup.sh`, all the packages should be at their latest versions. For python itself, I used 3.14.2, but I tested with 3.11, and this should not be a problem.

Because of how `torch.load` handles certain objects in 2.6+, `weights_only = False` has been added as a function argument on line 279 of `run_llama.py`. This is necessary, because otherwise the function will only load weights and will not properly load “args” and “model_config”.

2 Running the Tests

Both the `rope_test.py` test and the `optimizer_test.py` test succeed, however `sanity_check.py` fails. I think this is due to using pytorch 2.10 over pytorch 2.1, but it should not be an issue because all the code that matters for the assignment executes correctly.
